

METHOD AND APPARATUS TO VALIDATE A DATE INPUT

Abstract

A technique for validating a date input using a date creating function of a particular software language is provided. The date validation technique compares a date value inputted by a user and a date generated by the particular software language, and if the comparison shows that the two dates are equivalent, then the user inputted date is deemed to be valid. Otherwise, if the two dates are not equivalent, then the user inputted date is deemed to be invalid.
